

Synopsis of *Cnidoscolus* series
Cnidoscolus (Euphorbiaceæ), with
description of a new species

Francisco Javier FERNÁNDEZ CASAS
&
José María PIZARRO DOMÍNGUEZ

FONTQUERIA 55(8): 39-46
MADRID & SAINT LOUIS, 14-XII-2001

FONTQUERIA is a series of botanical publications without administrative affiliation. It publishes original works in Botany, particularly those that are of interest to the editors. Its publications are in any language, the only limitation being the ability of the team of editors.

Acredited with the *International Association for Plant Taxonomy* for the purpose of registration or new non-fungal plant names.

FERNÁNDEZ CASAS, F. J. & J. M. PIZARRO DOMÍNGUEZ (14-XII-2001). Synopsis of *Cnidoscolus* series *Cnidoscolus* (*Euphorbiaceæ*), with description of a new species. *Fontqueria* 55(8): 39-46.

Key words. *Cnidoscolus* (*Euphorbiacæ*), New series, New species, (Brazil, Peru).

Abstract. The type series of the genus *Cnidoscolus* (*Euphorbiaceæ*) is created autonymously when the new series *Loasiformes* (Pax) Fdez. Casas & Pizarro is here proposed. The autonymous series has three well known species, from Peru and Brazil, and a fourth one from Peru that is presented as new: *C. Liesneri* Fdez. Casas & Pizarro.

Resumen. La serie típica del género *Cnidoscolus* (*Euphorbiaceæ*) se crea por autonomía al desglosar aquí la nueva serie *Loasiformes* (Pax) Fdez. Casas & Pizarro de la subsección *Cnidoscolus*. La serie autónoma comprende tres especies bien conocidas, de Perú y Brasil, más una cuarta que se describe nueva de Perú: *C. Liesneri* Fdez. Casas & Pizarro.

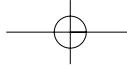

This paper deals with the type series of the genus *Cnidoscolus* Pohl (*Euphorbiaceæ*). It is intended to clarify the nomenclature of the series, to distinguish its four species in a key, and to describe a new species from Peru.

The sample of the new species was communicated to us by our charming friend Ronald L. Liesner, to whom we are pleased to dedicate it.

THE DIVISION NAMES OF THE GENUS *CNIDOSCOLUS* Pohl

The nomenclature of subdivisions in the genus *Cnidoscolus* has caused some confusion. The problems begin with the series of names based on the same nomenclatural type of the genus: subgenus, section, subsection, and series. All must be also named *Cnidoscolus* in accordance with the nomenclatural rules, cf. W. GREUTER & AL., *International Code of Botanical Nomenclature (Saint Louis Code) 2000*: sect. 3, art. 20 (2000).

We accept the generic typification first proposed by J. K. SMALL, in N. L. BRITTON & A. BROWN (1913: 462), who designated the species *Cnidoscolus hamosus* Pohl as the nomenclatural type of the genus; such typification was accepted, cf. R. MCVAUGH (1944: 462), G. J. BRECKON (1975: 105). The type species of the genus is also the nomenclatural type for the typical subgenus, section, subsection and series. At each level, that name is in homotypic synonymy with any other which has the same species as type; due to its autonymous condition it has priority over any other given name. However, this fact does not always coincide with the author's intentions. For example, the section *Hamosæ* Pax is a mere synonym of the autonymous section *Cnidoscolus*, although this is contradictory to Pax's wish, when he proposed his section as separate from

the type one.

The new series *Cnidoscolus* is generated autonymously when we propose in this paper the new series *Loasiformes* (Pax) Nobis. We do not know of any other previous series proposed in the genus which could have generated the autonym before. We have segregated the series from the subsection *Cnidoscolus* as it is defined by R. McVAUGH (1944: 463, 1b), our fundamental guide in this genus.

Following is the nomenclature of series *Cnidoscolus* and *Loasiformes* with the infra-generic levels separated and numbered:

I ***Cnidoscolus*** Pohl, Pl. bras. icon. descr. 1: 56, v (1827), nom. conserv.

basali et media, sed in apicali approximati sunt; foliis aliquo modo *Strychni* similia.

Inflorescentiae pauciflorae, breviter pedunculatae, folias longitudinem non superantes; bracteae late triangulares. Flores masculi albi, ad 20 mm. Calyx usque ad medium quinquefidus, sepalis adultis patentibus. Stamina ad 26, sex verticillata, ut videtur sine staminodiis, 2-3 inferiores verticilli in tubo calycino inclusi sunt. Ovarium brevibus pilis stellatis tectum. Capsula 8 mm, pilis stellatis vestita.

Species amicissimo Ronald L. Liesner (MO), in floram tropicalem peritissimo, grato animo dicamus.

Shrub; branches thick, woody, without spines, coarsely stinging, the young ones mainly minutely pubescent.

Petiole 12-30 mm, with stinging bristles, minutely pubescent. Limb broadly ovate, 65-128 × 55-96 mm, cuneate at base, the tip pointed or mucronate, rotunded or shortly emarginate, stinging at margin and beneath along the main nerve; on the upper side entirely glabrous except on the margin; beneath entirely glabrous except for the short pubescence near the base and along the main three nerves; the margin with sparse stinging hairs, it first seems entire but with a lens it appears decidedly and minutely dentate, ciliate with very short hairs ca. 0.1 mm, mainly near apex; the teeth well spaced arising where a nervule reaches the margin, 0.5 mm, acute triangular, leathery; the main three nerves clear, on the upper side sunken, beneath prominent, very prominent near the base; the two first lateral nerves much longer than the remaining lateral ones, arising from the base and reaching beyond the middle of the leaf blade and running near the margin; the other lateral nerves distant but near each other at apex; the leaves somewhat resembling those of the genus *Strychnos*.

Inflorescence few-flowered, short pedunculate, shorter than the leaves; bracts broadly triangular. Stamine flowers white, near 20 mm. Calyx divided to the middle, the segments outspread at maturity. Stamens about 26, 6-whorled, to all appearances without staminodes, the lower 2-3 whorls included in the calyx tube, the upper whorls exserted. Ovary covered with stellate hairs. Capsule 8 mm, also covered with stellate hairs.
