

EDITORIAL

The journal Brazilian Journal of Information Science (BJIS) initially presents a survey of information retrieval through the use of search engines. The research highlights the importance of this type of tool to be effective regardless of language, effectively information retrieving initially sued in any language. Another aspect discussed in the article refers to the analysis of sites from different locations, which shows the limitations of these assessment tools about the selection and ranking of popular sites.

The second article focuses on the fact that Science is for different people or groups. For this, the author examines the theories and concepts applied to the scientific production process, but the most important questions the relationship between Science and power in the construction of scientific knowledge.

The last article presents an articles citation analysis published in Journal of Library and Information Science (JOLIS), published in Nigeria, Africa, covering the period 2004 to 2009. From this perspective, several tests were performed and presented, highlighting the average citations, the most cited journals, authorship pattern, and geographic location of the above and other aspects.

Good reading!
