Abstract: The soft-winged flower beetle *Protaetia flavigaster* (Mulsant & Rey, 1853) (Coleoptera: Melyridae: Malachiinae) is reported from Portugal for the first time, extending the known distribution range of the species to the southwestern corner of Iberia.

Key words: Coleoptera, Melyridae, Malachiinae, *Protaetia flavigaster*, first record, Portugal.

Resumen: Primer registro de *Protaetia flavigaster* (Mulsant & Rey, 1853) (Coleoptera: Melyridae: Malachiinae) para Portugal. Se cita *Protaetia flavigaster* (Mulsant & Rey, 1853) (Coleoptera: Melyridae: Malachiinae) por primera vez de Portugal, ampliando al extremo sudoeste la distribución ibérica conocida de la especie.

Palabras clave: Coleoptera, Melyridae, Malachiinae, *Protaetia flavigaster*, primer registro, Portugal.

Introduction

Protaetia flavigaster (Mulsant & Rey, 1853) (Coleoptera: Melyridae: Malachiinae) is a soft-winged flower beetle described from the vicinity of Montpellier (France) as *Apalochrus flavigaster* (MULSANT & REY, 1853). The known range of *P. flavigaster* includes: in Europe, France (mainland and Corsica), Greece (mainland, Crete, and Lesbos), Hungary, Italy (mainland, Sardinia, and Sicily), Romania, Spain (mainland and the Balearic Islands), and the "Caucasus"; in Africa, Algeria, Egypt, Morocco, and Tunisia; and in Asia, Cyprus, Iran, Russia (Krasnodarskii Krai), Tajikistan, and Turkey (MAYOR, 2007; EL-TORKEY et al., 2012; TSHERNYSHEV, 2016).

In the Iberian Peninsula, this species was first reported from Andalusia, the southernmost Spanish autonomous community (KIESENWETTER, 1866). Since then, the first detailed records were published from the Spanish provinces of Murcia (UHAGÓN, 1901), Valencia (MORODER SALA, 1924), and Cádiz (PARDO ALCAIDE, 1975), and in the Balearic Islands from Menorca (CARDONA ÓRFILA, 1878) and Majorca (PLATA NEGRACHE & SANTIAGO HERNÁNDEZ, 1990).

In this contribution, we report *P. flavigaster* from mainland Portugal for the first time, extending the known distribution range of the species to the southernmost Portuguese district of Faro.

New record

Faro district: Loulé municipality: Vilamoura marshes (37.088250, -8.135111; MGRS: 29SNB7605; 4 m a.s.l.), 20/07/2022, one individual photographed by Thijs Valkenburg (Fig. 1) after being detected using a beating tray: <https://www.inaturalist.org/observations/127192696>.

Discussion

The record presented herein adds the malachiine tribe Apalochrini Mulsant & Rey, 1867 and therefore the genus *Protapalochrus* Evers, 1987 to the Portuguese fauna and extends the known distribution range of *P. flavolimbatus* to the westernmost corner of Iberia, as shown in Map 1.

According to POHER *et al.* (2017), *Protapalochrus flavolimbatus* is a hygrophilous species that lives on *Typha latifolia* L., *Phragmites australis* (Cav.) Trin ex Steud. (=*Phragmites communis* Trin) and *Juncus* sp. where adults and larvae hunt other insects. The low number of Iberian records and the seemingly discontinuous distribution in Iberian may result from this ecological specificity and an under-sampling of those plants.

The observation in mid-July in the Vilamoura marshes is in accordance with the adult phenology reported by various authors, who collected the species between early April and late October (SZALÓKI & MERKL, 2005; EL-TORKEY *et al.*, 2012; PLATA NEGRACHE, 2012; TSHERNYSHEV, 2016).
